EXPERIENCE

Google | Site Reliability Software Engineer (Distributed Storage) | New York, NY **Aug 2024 - Present**

Reliability, deployments, and new-hardware onboarding for the storage-server layer that manages physical disks for Google's distributed file system (Colossus), across hundreds of storage clusters.

- Cut software rollout time per storage cluster by 33% (~6.4 to ~4.3 hours) by replacing fixed 12-minute waits with a per-server readiness check that confirms data is available again before the next server updates.
- Built a C++ rollout safety check that pauses upgrades when a cluster already has degraded hardware, so an upgrade can't deepen an ongoing outage; it blocked unsafe upgrades in 224 clusters (37% of the fleet) in 8 weeks.
- Dry-ran a stricter server-health rollout check in shadow mode across ~47,000 server updates with a custom metrics pipeline; it would pause only 0.04% of updates, adding safety at negligible rollout cost.
- Fixed a crash-loop detection gap that had caused outages in a cloud block-storage product by doubling the restart-detection window (30 to 60 minutes), so slow crash loops are caught and taken out of service.
- Validated three new enterprise HDD and NVMe SSD models for fleetwide deployment by leading multi-petabyte production pilots with hardware and firmware teams.
- Designed a chaos-testing orchestrator for new-drive validation (estimated to save ~40-80 engineer-hours per drive model) and built the daily pipeline that selects test servers within blast-radius limits.
- Served as incident commander for 7 escalated production incidents, including recovery of 250+ storage servers in a major outage; wrote 9 postmortems across ~95 days of primary on-call shifts.
- Built LLM-based on-call assistants that translate engineer questions into diagnostic commands, with least-privilege access and human approval required for any production change.

Amazon | Software Development Engineer Intern **May 2022 - Aug 2023**

- Reduced customer errors by 40% by building core features for a SaaS tool on a scalable AWS backend (Java, Lambda, API Gateway, VPCs).
- Led a team of four interns through design reviews, breaking a complex product spec into small, tested deliverables.
- Wrote 30+ pages of technical documentation and 20+ unit tests, and maintained the team's CI/CD pipeline.

USC Viterbi School of Engineering | Undergraduate Teaching Assistant **Jun 2021 - May 2023**

- Mentored 100+ students in data structures, algorithms, and object-oriented design, and helped build course materials and exams.

EDUCATION

University of Southern California **May 2024**

M.Sc. Computer Science **GPA: 3.88**; B.Sc. Computer Science and Business Administration **GPA: 3.90** Los Angeles, CA

Honors: Viterbi Dean's List (Fall 2020 - Fall 2023)

SKILLS

- **Languages:** C++, Python, SQL, Java, TypeScript/JavaScript, Protocol Buffers
- **Distributed Systems & Infrastructure:** Distributed Storage, Linux, Progressive Rollouts & Release Gating, Chaos & Fault-Injection Testing, Monitoring & Observability Pipelines, Incident Response, LLM Agent Tooling
- **Tools & Platforms:** Git, Docker, AWS (Lambda, API Gateway, VPC), CI/CD Pipelines

LEADERSHIP & RECOGNITION

- **Mentorship:** Hosted a summer SRE intern who built an AI assistant that walks engineers through disaster-recovery runbooks; co-presented a career talk for high-school students in Pace University's Upward Bound program.
- **Recognition:** 6 peer-nominated awards (2025-2026) for incident debugging, AI tooling development, and intern mentorship.
